

# Hide A Butterfly

## Grades PreK-K-1-2

### National Science Education Standards

#### SCIENCE AS INQUIRY STANDARDS

##### LEVELS K-4

Abilities necessary to do scientific inquiry

Understanding about scientific inquiry

#### LIFE SCIENCE STANDARDS

##### LEVELS K-4

Characteristics of organisms

Organisms and environments

#### SCIENCE AND TECHNOLOGY STANDARDS

##### LEVELS K-4

Abilities of technological design

### Texas Essential Knowledge and Skills

#### Kindergarten Science

##### (a) Introduction.

- (1) In Kindergarten, science introduces the use of simple investigations and fieldwork to help students develop the skills of asking questions, gathering information, communicating findings, and making informed decisions. Using their own senses and common tools such as a hand lens, students make observations and collect information.
- (2) As students learn science skills, they identify component of the natural world including rocks, soil, and water. Students observe the seasons and growth as examples of change. In addition, Kindergarten science includes the identification of objects and their parts. Students learn how to group living and nonliving things and explore the basic needs of living things.
- (3) Science is a way of learning about the natural world. Students should know how science has built a vast body of changing and increasing knowledge described by physical, mathematical, and conceptual models, and also should know that science may not answer all questions.
- (4) A system is a collection of cycles, structures, and processes that interact. Students should understand a whole in terms of its components and how these components relate to each other and to the whole. All systems have basic properties that can be described in terms of space, time, energy, and matter. Change and constancy occur in systems

and can be observed and measured as patterns. These patterns help to predict what will happen next and can change over time.

- (5) Investigations are used to learn about the natural world. Students should understand that certain types of questions can be answered by investigations, and that methods, models, and conclusions build from these investigations change as new observations are made. Models of objects and events are tools for understanding the natural world and can show how systems work. They have limitations and based on new discoveries are constantly being modified to more closely reflect the physical world.
- 

(b) Knowledge and skills

- |   |  |
|---|--|
| (1) Scientific processes. The student conduct laboratory investigations and fieldwork using safe, environmentally appropriate, and ethical practices. | The student is expected to:<br>(A) demonstrate safe practices during laboratory investigations and fieldwork; and<br>(B) make wise choices in the use and conservation of resources and the disposal of materials.                                 |
| (2) Scientific processes. The student develops abilities necessary to do science inquiry in both the field and the classroom.                         | The student is expected to:<br>(A) ask questions about objects and events;<br>(B) plan and conduct simple investigations;<br>(D) construct reasonable explanations using information; and<br>(E) communicate findings about simple investigations. |
| (3) Scientific processes. The student knows that information and critical thinking are used in making decisions.                                      | The student is expected to:<br>(A) make decisions using information, and<br>(B) discuss and justify the merits of decisions.   |
| (6) Science concepts. The student knows that objects have parts.  | The student is expected to:<br>(B) observe and record parts of plants including leaves, roots, stems, and flowers; and<br>(C) observe and record parts of animals including wings, feet, heads, and tails.   |
| (8) Science concepts. The student knows the difference between living and nonliving objects.  | The student is expected to:<br>(A) identify a particular object as living or nonliving.  |
| (9) Science concepts. The student knows that living things have basic needs.  | The student is expected to:<br>(A) identify examples of how living things meet their basic needs;<br>(B) give examples of how living things depend on each other, and<br>(C) identify ways hat the Earth provides resources for live.              |

## Grade 1 Science

### (a) Introduction.

- (1) In Grade 1, science introduces the use of simple investigations and fieldwork to help students develop the skills of asking questions, gathering information, making measurements using non-standard units, using tools such as a thermometer, to extend their senses, constructing explanations, and drawing conclusions.
  - (2) As students learn science skills, they identify component of the natural world including rocks, soil, and natural resources. Students observe that heat from the sun or friction, is an example of something that causes change. In addition, Grade 1 students identify basic needs of living things, explore ways that living things depend on each other, and group living an nonliving things. Students identify parts that can be put together with other parts to do new things.
  - (3) Science is a way of learning about the natural world. Students should know how science has built a vast body of changing and increasing knowledge described by physical, mathematical, and conceptual models, and also should know that science may not answer all questions.
  - (4) A system is a collection of cycles, structures, and processes that interact. Students should understand a whole in terms of its components and how these components relate to each other and to the whole. All systems have basic properties that can be described in terms of space, time, energy, and matter. Change and constancy occur in systems and can be observed and measured as patterns. These patterns help to predict what will happen next and can change over time.
  - (5) Investigations are used to learn about the natural world. Students should understand that certain types of questions can be answered by investigations, and that methods, models, and conclusions build from these investigations change as new observations are made. Models of objects and events are tools for understanding the natural world and can show how systems work. They have limitations and based on new discoveries are constantly being modified to more closely reflect the physical world.

- |  |  |
|--|--|
| (6) Science concepts. The student knows that objects have parts.             | The student is expected to:<br>(B) observe and describe the parts of plants and animals.   |
| (9) Science concepts. The student knows that living things have basic needs. | The student is expected to:<br>(A) identify and describe how living things meet their basic needs; and<br>(B) compare and give examples of how living things depend on each other for their basic needs. |

## Grade 2 Science

### (a) Introduction.

- (1) In Grade 2, science introduces the use of simple investigations and fieldwork to help students develop the skills of making measurements using standard and non-standard units, using tools such as rulers and clocks to collect information, classifying and sequencing objects and events, and identifying patterns.
  - (2) As students learn science skills, they identify component of the natural world including the water cycle and the use of resources. They observe melting and evaporation, weathering, and the pushing and pulling of objects as examples of change. In addition, Grade 2 students identify characteristics of living and nonliving things, compare lifelong need of plants and animals, understand how living things depend on their environments, and identify functions of parts of plants and animals.
  - (3) Science is a way of learning about the natural world. Students should know how science has built a vast body of changing and increasing knowledge described by physical, mathematical, and conceptual models, and also should know that science may not answer all questions.
  - (4) A system is a collection of cycles, structures, and processes that interact. Students should understand a whole in terms of its components and how these components relate to each other and to the whole. All systems have basic properties that can be described in terms of space, time, energy, and matter. Change and constancy occur in systems and can be observed and measured as patterns. These patterns help to predict what will happen next and can change over time.
  - (5) Investigations are used to learn about the natural world. Students should understand that certain types of questions can be answered by investigations, and that methods, models, and conclusions build from these investigations change as new observations are made. Models of objects and events are tools for understanding the natural world and can show how systems work. They have limitations and based on new discoveries are constantly being modified to more closely reflect the physical world.
